HR ANALYTICS DASHBOARD

Power BI Project Report

Employee Attrition & Workforce Insights

Prepared by	Chetana Wagh
Platform	Microsoft Power BI
Project Type	HR Analytics & Data Visualization

A portfolio report describing dashboard scope, KPIs, analysis approach, tools and recommended improvements. Numerical findings are not invented; add verified values from the actual Power BI report.

1. Executive Summary

The HR Analytics Dashboard is a Power BI visualization project designed to explore workforce composition, employee attrition and job satisfaction. It brings selected HR metrics into a visual report and supports comparisons across departments, job roles, salary slabs and age groups.

This report documents the intended analytical scope. Exact numerical findings are omitted because verified KPI values and output data were not provided.

2. Project Objectives

- Summarize key workforce metrics with KPI cards.
- Explore attrition across departments, job roles, salary slabs and age groups.
- Compare job satisfaction across job roles.
- Make HR data easier to interpret through visual summaries.
- Support evidence-informed HR discussion and further investigation.

3. Dashboard Sections

Section	Purpose
KPI Cards	Display headline workforce and attrition measures.
Department Analysis	Compare employee counts or attrition across departments.
Salary Slab	Explore attrition patterns by salary range.
Job Role & Satisfaction	Compare reported satisfaction ratings across roles.
Age Group	Show employee distribution across age categories.
Interactive Filter	Narrow report views by department where configured.

4. Key Performance Indicators

- Total Employees: total employee records included in the report.
- Active Employees: retained employees according to the dataset's status definition.
- Attrition Count: employees marked as having left.
- Attrition Rate: attrition count divided by a consistently defined population.
- Average Age / Experience: profile measures, if included in the dashboard.

Validation: Confirm the formula, denominator, reporting period and filter context for each KPI before publishing values.

5. Analysis Approach

- Compare attrition by department, job role, salary slab and age group.
- Review satisfaction ratings by role and consider sample size.
- Use filters or slicers to inspect subsets while preserving context.

- Check missing values, duplicates and category labels before interpreting results.
- Describe chart patterns as associations; do not claim causation without additional evidence.

6. Tools & Skills

- Microsoft Power BI for dashboard development and visualization.
- KPI cards, charts, segment comparisons and interactive filters.
- Power Query for data preparation, if used.
- DAX for measures, if used.
- Analytical storytelling and business-oriented reporting.

7. Suggested GitHub Structure

```
HR-Analytics-PowerBI/
■■■ HR-Analytics-Dashboard.pbix
■■■ README.md
■■■ screenshots/
    ■■■ dashboard.png
```

Update the example PBIX filename to match the uploaded file. Add a high-resolution dashboard screenshot and document the source dataset where possible.

8. Limitations

- Results depend on the underlying dataset and report filters.
- Definitions of active employees, attrition and salary slabs should be documented.
- Visual patterns alone cannot explain why employees leave.
- List only tools and features actually used in the project.

9. Conclusion & Future Enhancements

The dashboard provides a consolidated visual way to explore workforce composition, attrition and job satisfaction. Validate all measures and labels before sharing publicly.

- Add time-based trends if date fields are available.
- Add drill-through pages for deeper department or role analysis.
- Document the dataset source and data dictionary.
- Add verified insights and screenshots to the GitHub README.
